

# Detector challenges for future high-energy $e^+e^-$ colliders

Eva Sicking (CERN)

Technology and Instrumentation in Particle Physics Conference 2017

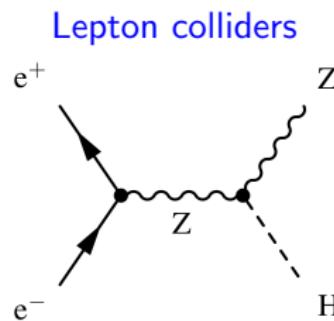

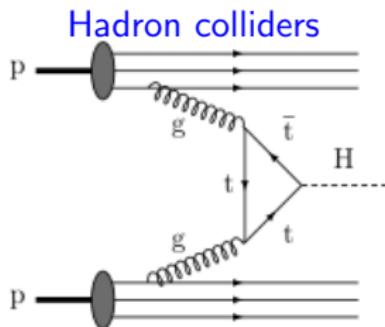

Beijing, China – May 22, 2017

# Introduction

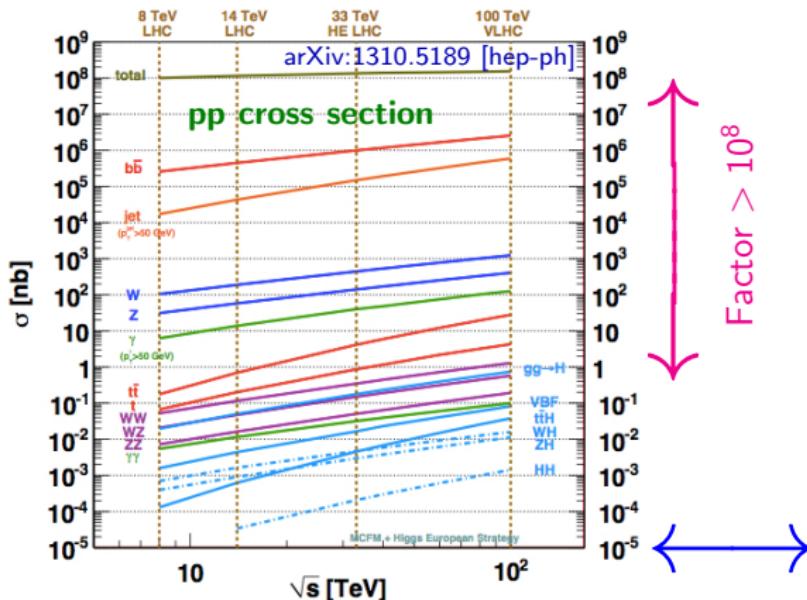

# Hadron vs. lepton colliders

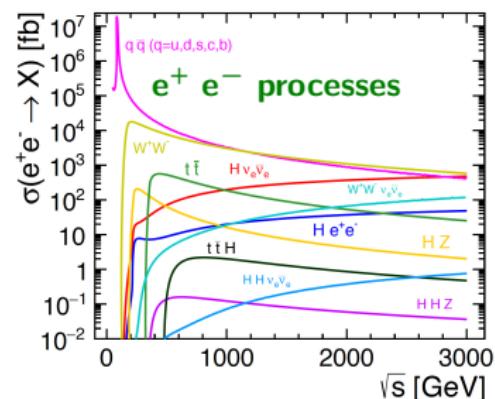

- 1) Proton is compound object
  - Initial state unknown
  - Limits achievable precision
- 2) High rates of QCD backgrounds
  - Complex triggers
  - High levels of radiation
- 3) Very high-energy circular colliders feasible

- 1)  $e^+e^-$  are point-like
  - Initial state well-defined (energy, opt.: polarisation)
  - High-precision measurements
- 2) Clean experimental environment
  - Less/no need for triggers
  - Lower radiation levels
- 3) Very high energies require linear colliders

# pp vs. $e^+e^-$ cross sections

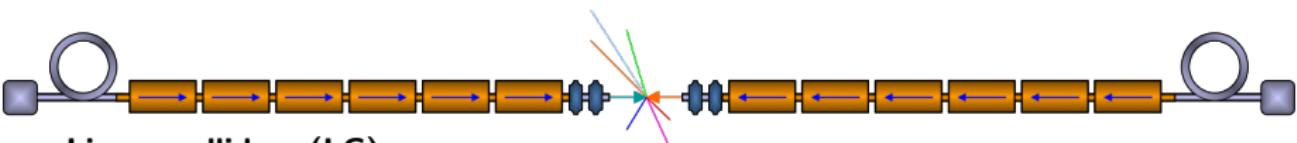

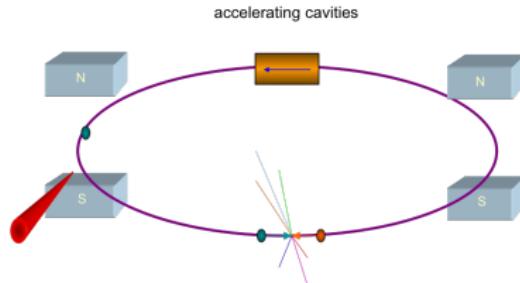

- In pp collisions, interesting events need to be found in huge number of collisions
- $e^+e^-$  collisions more clean

# Circular vs. linear $e^+e^-$ colliders

- **Circular colliders (CC)**

- Can accelerate beam in many turns
- Can collide beam many times
- Possibility of several interaction regions
- **Limited energy due to synchrotron radiation**
  - Synchrotron radiation per turn  
 $\sim \text{Energy}^4 / (\text{Mass}^4 \cdot \text{Radius})$
  - $\text{Mass}_{\text{proton}} / \text{Mass}_{\text{electron}} \approx 2000$
  - E.g. 2.75 GeV/turn lost at LEP for  $E = 105$  GeV

- **Linear colliders (LC)**

- Very little synchrotron radiation in a linac
- Can reach high energies
- **Have to achieve energy in a single pass**  
 $\rightarrow$  High acceleration gradients needed
- **One interaction region**
- **Have to achieve luminosity in single pass**  
 $\rightarrow$  Small beam size and high beam power  
 $\rightarrow$  **Beamstrahlung, energy spread**

# High-energy $e^+e^-$ collider proposals

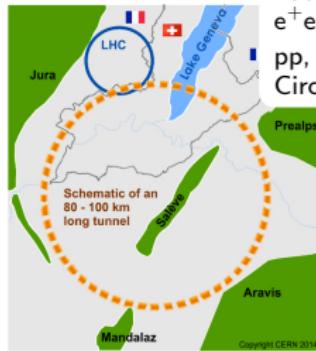

## Circular Electron Positron Collider (CEPC)

$e^+e^-$ ,  $\sqrt{s} = 240\text{-}250 \text{ GeV}$ ; SPPC pp,  
Circumference: 54-100 km

## Future Circular Collider (FCC)

$e^+e^+$ ,  $\sqrt{s} = 90\text{-}350 \text{ GeV}$ ;  
pp,  $\sqrt{s}:\sim 100 \text{ TeV}$   
Circumference: 90-100 km

# High-energy $e^+e^-$ collider proposals

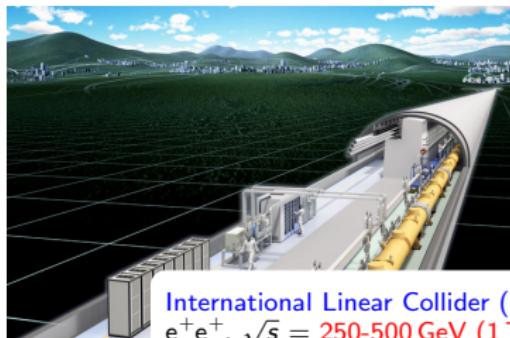

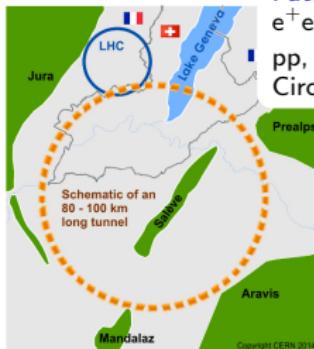

## Circular Electron Positron Collider (CEPC)

$e^+e^-$ ,  $\sqrt{s} = 240\text{-}250 \text{ GeV}$ ; SPPC pp,  
Circumference: 54-100 km

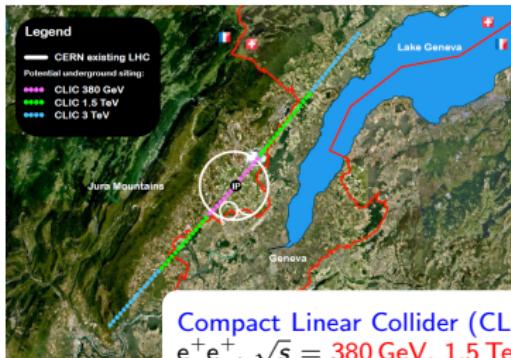

## Future Circular Collider (FCC)

$e^+e^+$ ,  $\sqrt{s} = 90\text{-}350 \text{ GeV}$ ;  
pp,  $\sqrt{s} \sim 100 \text{ TeV}$   
Circumference: 90-100 km

International Linear Collider (ILC)  
 $e^+e^+$ ,  $\sqrt{s} = 250\text{-}500 \text{ GeV}$  (1 TeV)  
Length: 31 km (50 km)

Compact Linear Collider (CLIC)  
 $e^+e^+$ ,  $\sqrt{s} = 380 \text{ GeV}, 1.5 \text{ TeV}, 3 \text{ TeV}$   
Length: 11 km, 29 km, 50 km

# Status of projects

- ILC:
- TDR/DBD in 2013;
  - European XFEL in operation using similar accelerator technology;
- CLIC:
- CDR in 2012;
  - Staging baseline document in 2016;
  - Project Implementation Plan planned for 2018;
- CEPC:
- pre-CDR in 2015;
  - CDR planned for 2017;
- FCC-ee:
- CDR planned for 2018;

TDR: Technical design report

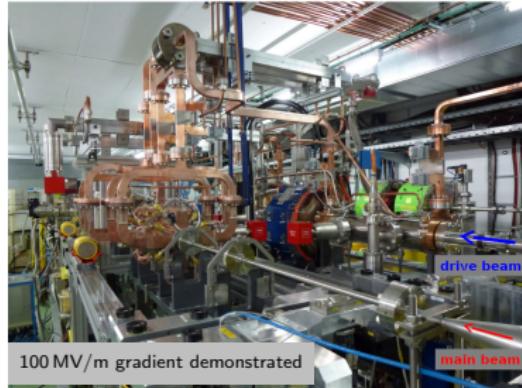

DBD: Detailed Baseline Design

CDR: Conceptual design report

**XFEL operation since Dec. 2016**

**CLIC two beam test stand**

# Experimental conditions in linear and circular colliders

→ Impact on detector design

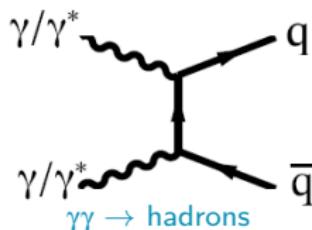

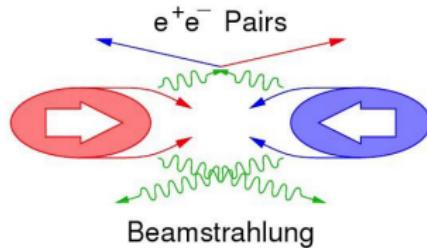

# Difference between pp and $e^+e^-$ environment

- Detectors for hadron colliders
  - Large QCD backgrounds
  - Focus on radiation hardness of many sub-detectors
- Detectors for  $e^+e^-$  colliders
  - Cleaner  $e^+e^-$  collisions
  - Beam-induced backgrounds dominating source of radiation damage
  - Hadronic radiation damage only relevant in very forward detectors ( $\theta \sim 10 \text{ mrad} - 38 \text{ mrad}$ )

# Beam-induced backgrounds

- **Linear collider:** Achieve high luminosities by using extremely small beam sizes  
→ 3 TeV CLIC: Bunch size:  $\sigma_{x;y;z} = \{40 \text{ nm}; 1 \text{ nm}; 44 \mu\text{m}\}$  → beam-beam interactions

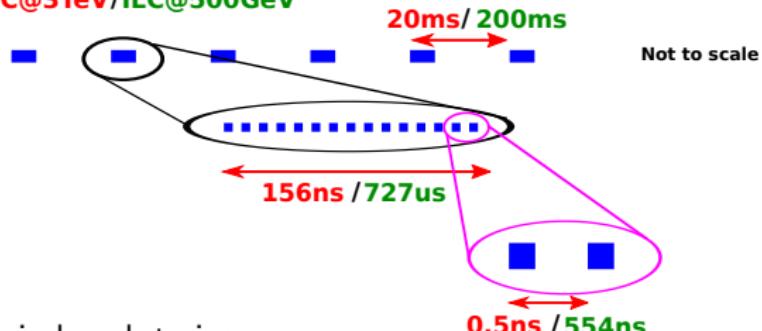

Main backgrounds ( $p_T > 20 \text{ MeV}$ ,  $\theta > 7.3^\circ$ )

- **Incoherent e<sup>+</sup>e<sup>-</sup> pairs:**
  - 19k particles / bunch train at 3 TeV
  - High occupancies  
→ **Impact on detector granularity**
- $\gamma\gamma \rightarrow \text{hadrons}$ 
  - 17k particles / bunch train at 3 TeV
  - Main background in calorimeters and trackers  
→ **Impact on detector granularity and physics**

- 
- **Circular colliders:** Same processes + synchrotron radiation
  - Background yields depend strongly on beam energy → currently under study

# Duty cycle and bunch separation in linear colliders

**Beam structure: CLIC@3TeV/ILC@500GeV**

- Linear colliders operate in bunch trains
  - **Low duty cycle**
  - Possibility of **power pulsing** of detectors
- **Bunch separation** impacts on detector design

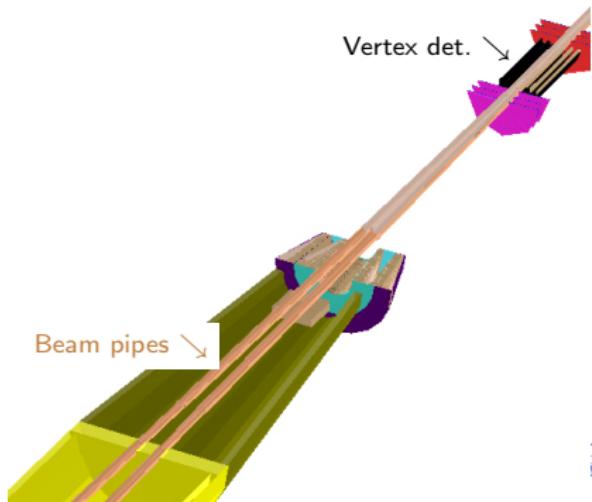

Property $\sqrt{s}$	ILC		CLIC	
	500 GeV	1 TeV	380 GeV	3 TeV
Repetition rate	5 Hz	4 Hz	50 Hz	50 Hz
Train duration	727 $\mu$ s	897 $\mu$ s	178 ns	156 ns
BX / train	1312	2450	356	312
Bunch separation	554 ns	366 ns	0.5 ns	0.5 ns
Duty cycle	0.36%	0.36%	0.00089%	0.00078%

# High luminosities in circular colliders

Property	Unit	FCC-ee (100 km)				CEPC (54km)
		45.6	80	120	175	
Beam energy	GeV					120
Luminosity/IP	$10^{34} \text{ cm}^{-2} \text{s}^{-1}$	90	19	5.1	1.3	2.0
Bunches / beam	91500	5260	780	81	50	
Bunch separation	ns	2.5	50	400	4000	-

## FCC-ee beam pipe proposal

- Luminosities of up to  $\sim 10^{36} \text{ cm}^{-2} \text{s}^{-1}$ 
  - Large number of bunches
- Consequences for detector design
  - Crossing angle of  $\theta_c = 30 \text{ mrad}^\dagger$  to avoid parasitic collisions
  - Bunch separation impacts on detector design
  - No power pulsing of detectors

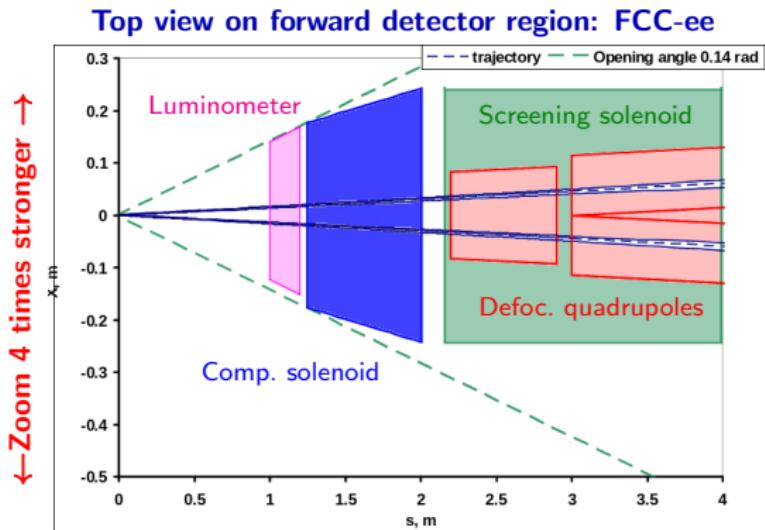

<sup>†</sup> CLIC:  $\theta_c = 20 \text{ mrad}$

# Machine-detector interface in circular colliders

- High luminosities: last focusing quadrupole “QD0” very close to IP:
  - $L^* \approx 2.2 \text{ m}$  @ FCC-ee
  - $L^* \approx 1.5 \text{ m}$  @ CEPC
- Protect QD0 from main magnetic field → Screening solenoid around QD0
- Compensating solenoid to prevent emittance blow-up due to non-zero crossing angle

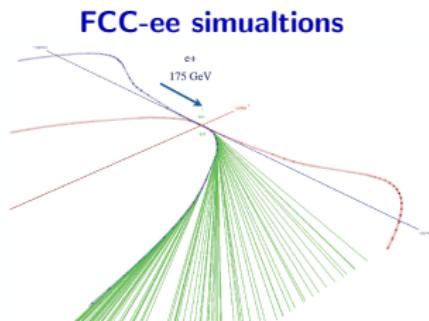

Example: FCC-ee

- Luminometer at only **1 m** from interaction point
  - Limits detector acceptance window to polar angles of  $\pm 150 \text{ mrad}$
- Limits magnetic field of main solenoid to  **$B=2 \text{ T}$** 
  - Need to increase tracker radius to maintain momentum resolution

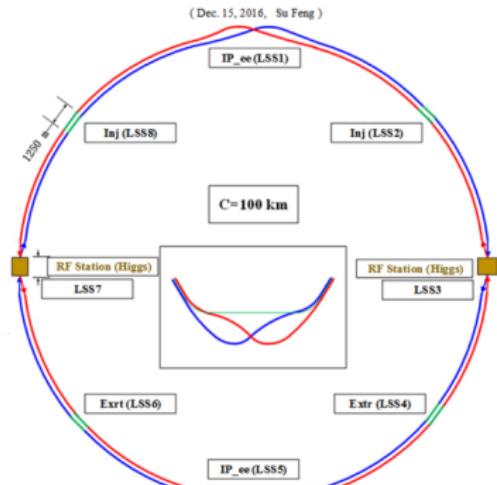

# Synchrotron radiation in circular colliders

- **Synchrotron radiation** from bending high-energy electron beam on circular trajectory
  - Limit synchrotron radiation in interaction region by **bending the beams as little as possible** upstream to the IP → “**Asymmetric layout**”

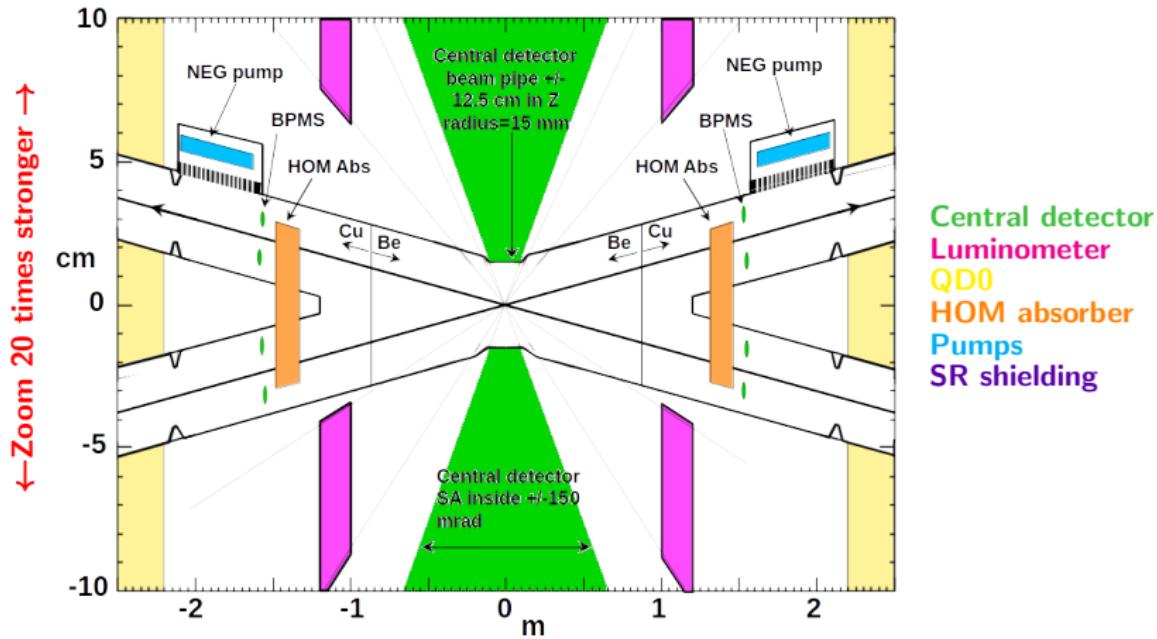

**Current CEPC baseline**

Property	Unit	FCC-ee (100 km)				CEPC (54 km)
Energy/beam	GeV	45.6	80	120	175	120
Energy loss / turn	GeV	0.03	0.33	1.67	7.55	3.11

# Synchrotron radiation in circular colliders: Shielding

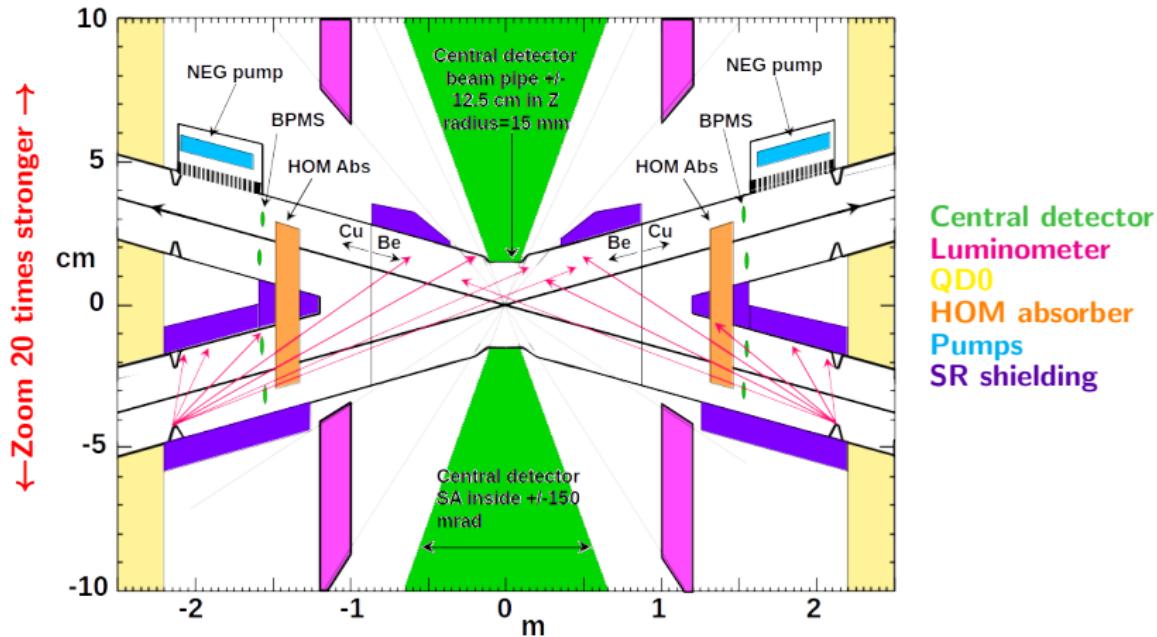

- Close to the detector region, additional **shielding** to prevent synchrotron radiation/secondary radiation to enter the detector

- Cooling of beam pipe needed → increased material budget at the IP

# Synchrotron radiation in circular colliders: Shielding

- Close to the detector region, additional **shielding** to prevent synchrotron radiation/secondary radiation to enter the detector

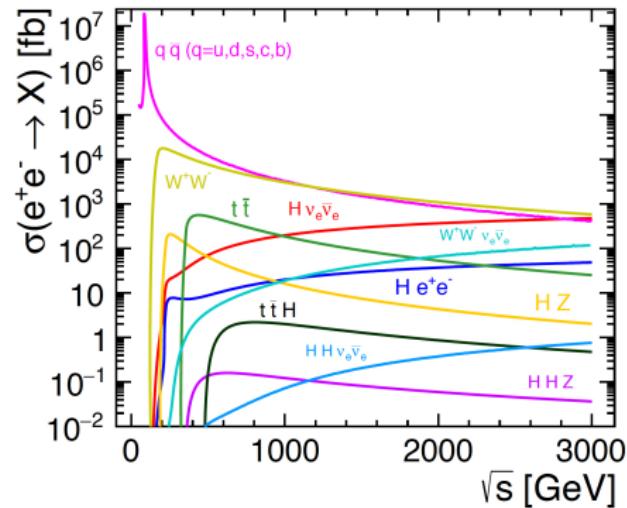

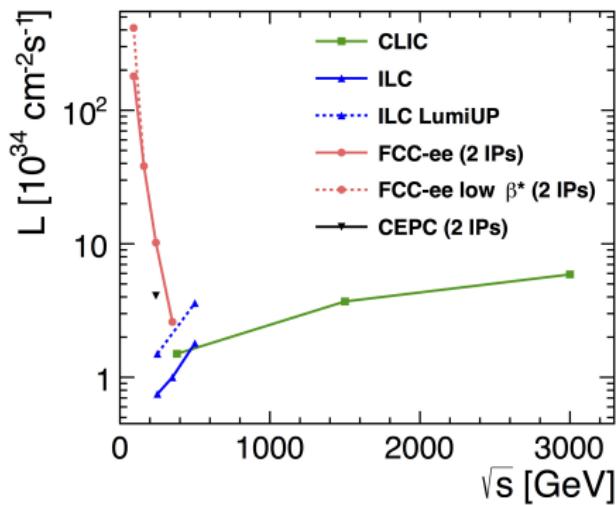

- Cooling of beam pipe needed → increased material budget at the IP

# Physics programme

→ **Detector requirements**

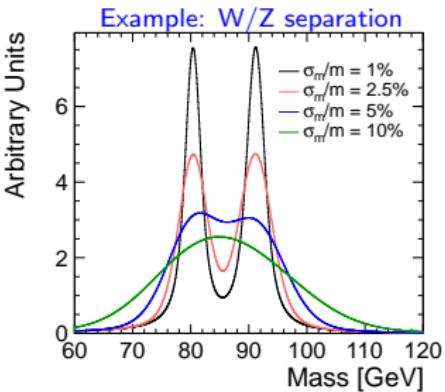

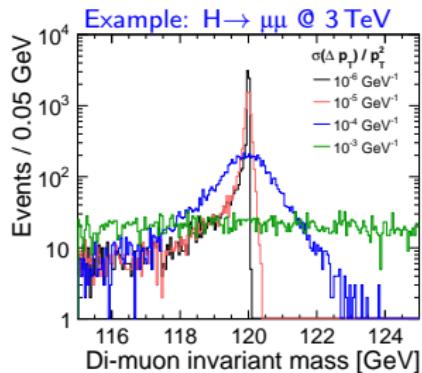

# Energy reach → physics programmes

- Physics programmes focus on **precision measurements** of
  - FCC-ee: Z, W, Higgs, top
  - CEPC: Higgs (Z, W under discussion)
  - ILC: Higgs, top, direct high-mass BSM searches
  - CLIC: Higgs, top, direct high-mass BSM searches

# Linear collider detector needs

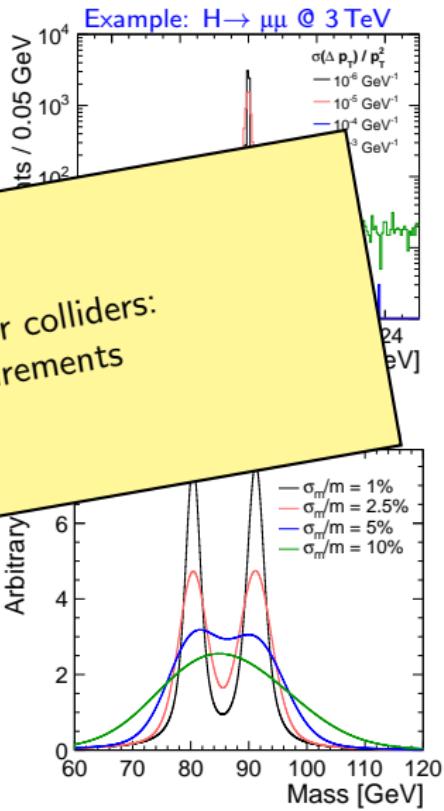

- Momentum resolution
  - Higgs recoil mass, smuon endpoint,  
Higgs coupling to muons  
 $\rightarrow \sigma_{p_T}/p_T^2 \sim 2 \times 10^{-5} \text{ GeV}^{-1}$  above 100 GeV
- Impact parameter resolution
  - c/b-tagging, Higgs branching ratios  
 $\rightarrow \sigma_{r\varphi} \sim a \oplus b/(p[\text{GeV}] \sin^{\frac{3}{2}} \theta) \mu\text{m}$
  - $a = 5 \mu\text{m}$ ,  $b = 10 - 15 \mu\text{m}$
- Jet energy resolution
  - Separation of W/Z/H di-jets  
 $\rightarrow \sigma_E/E \sim 3.5\%$  for jets at 50-1000 GeV
- Angular coverage
  - Very forward electron and photon tagging  
 $\rightarrow$  Down to  $\theta = 10 \text{ mrad}$  ( $\eta = 5.3$ )
- Requirements from beam structure and beam-induced background
- $\rightarrow$  Note: Ongoing study to re-define needs for precision measurements

# Circular collider detector needs

- Momentum resolution
  - Higgs recoil mass, smuon endpoint,  
Higgs coupling to muons  
 $\rightarrow \sigma_{p_T}/p_T^2 \sim 2 \times 10^{-5} \text{ GeV}^{-1}$  above 100 GeV
- Impact parameter resolution
  - c/b-tagging, Higgs b
- Jet resolution
- Angle resolution
  - $\Delta\phi = 10 \text{ mrad}$  ( $\eta = 5.3$ )
- Requirements from beam structure and beam-induced background
- $\rightarrow$  Note: Ongoing study to re-define needs for precision measurements

Similar requirements at circular colliders:  
Needed for precision measurements

# Detector concepts

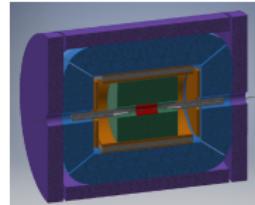

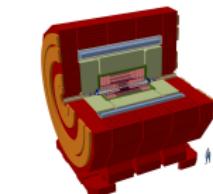

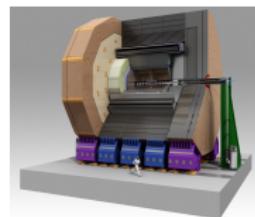

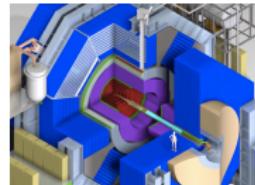

# Multi-purpose detectors for $e^+e^-$ colliders

- No large QCD backgrounds in  $e^+e^-$  collisions
  - Radiation hardness mainly for very forward direction
- Precision physics programme for  $e^+e^-$  colliders
  - Requires excellent flavour tagging and momentum resolution
    - Light-weight vertex and tracker detector, highly granular
  - Requires excellent energy resolution
    - Use excellent calorimeters, for instance based on particle flow

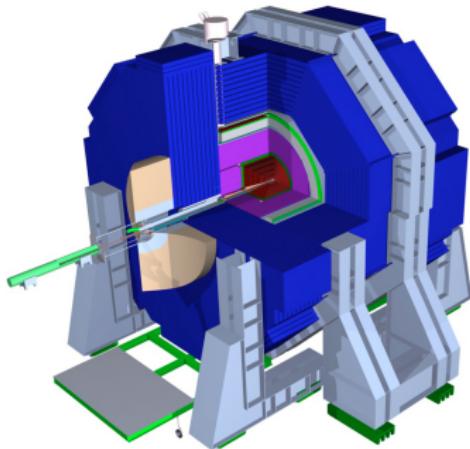

## ● Multi-purpose detectors

→ Onion-like arrangement of complementary sub-detectors

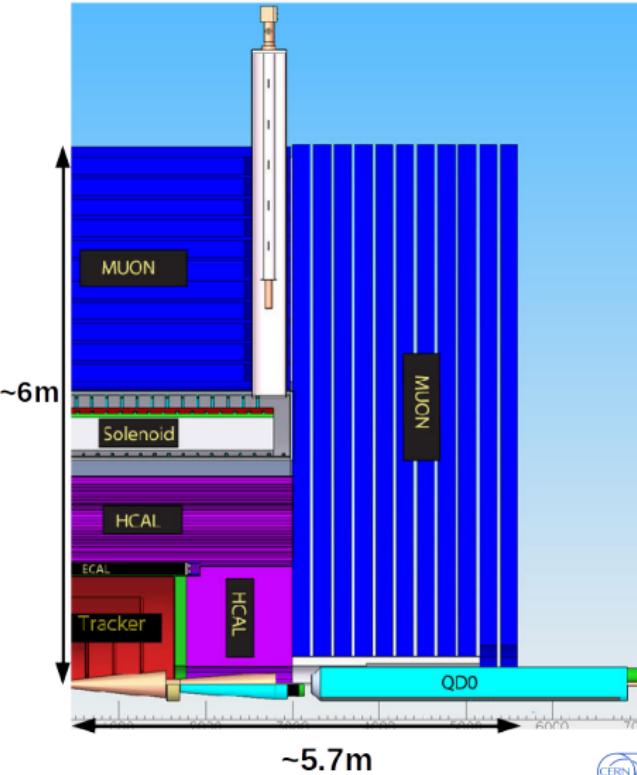

Vertex detector	→ measure track of charged particles → measure vertex position → measure impact parameter → flavour
Tracking detector	→ measure track of charged particles
El.-mag. calorimeter	→ measure energy of $\gamma, e^\pm$ and hadrons
Hadronic calorimeter	→ measure full energy of hadrons
Magnet system	→ bend charged particles → momentum
Muon system	→ identify muons
Hermiticity	→ measure missing energy (e.g. $\nu$ )

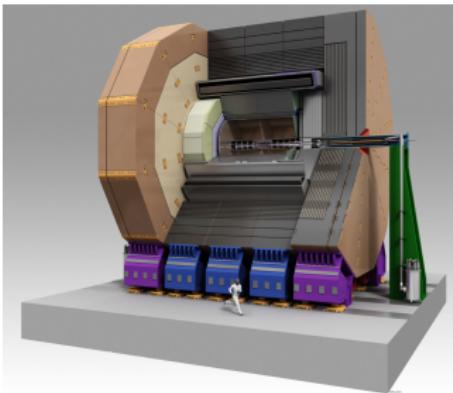

# SiD detector @ ILC

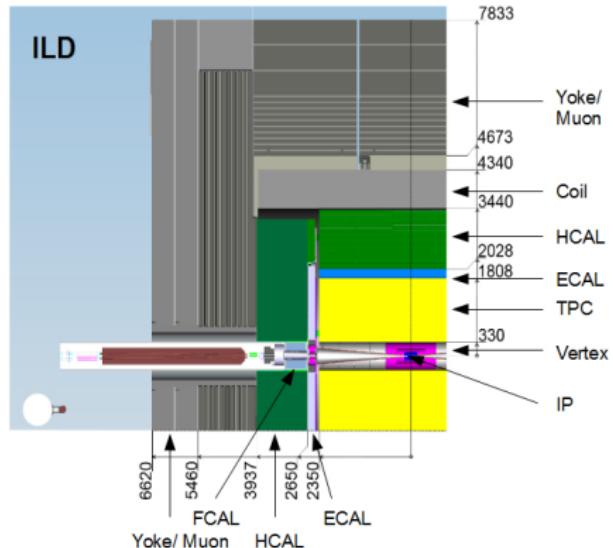

- **SiD:** "Silicon Detector"
- B-field of 5 T
- All-silicon vertex detector + tracker
- Fine-grained calorimetry  
→ Particle Flow Analysis
- Compact design ( $\sim 1.2$  m tracker radius)

# ILD detector @ ILC

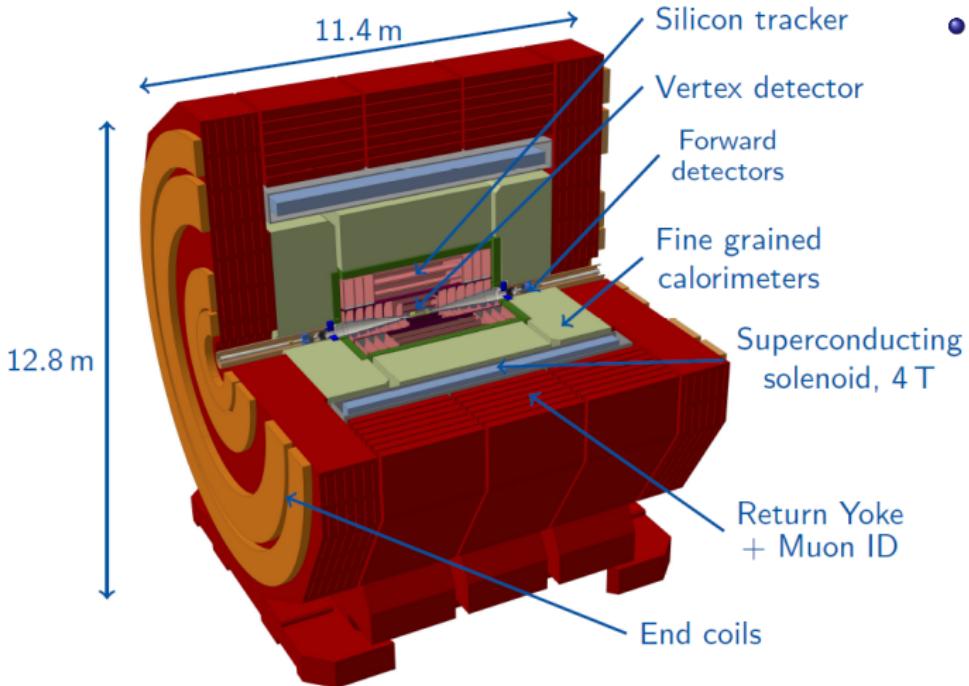

- **ILD:** “International Large Detector”
- Silicon vertex detector
- Time Projection Chamber as tracker surrounded by Silicon Envelope
- Fine-grained calorimetry (PFA)
- Re-optimisation: **Large (L)** and **small (S)** options under study

	ILD-L (DBD)	ILD-S
B-field	3.5 T	4 T
TPC outer radius	180 cm	146 cm
Coil inner radius	344 cm	310 cm

# CLIC detector: CLICdet

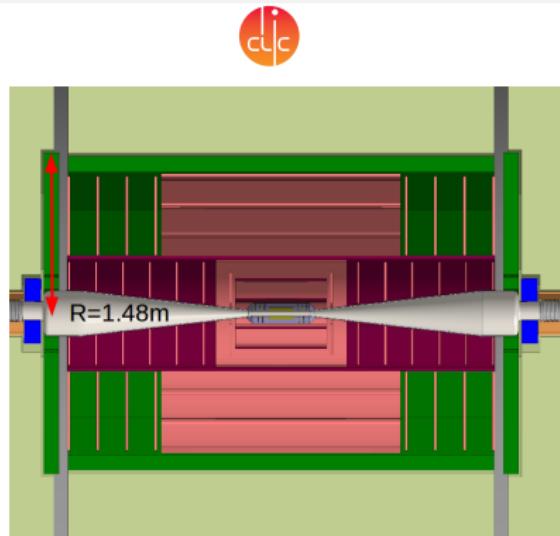

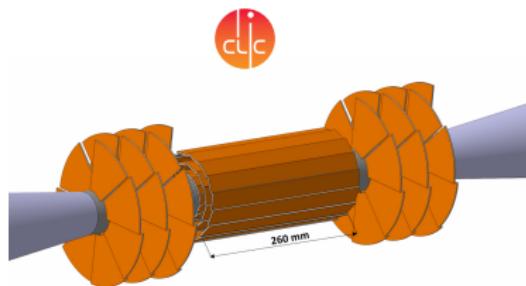

- SiD/ILD-inspired detector concept
  - B-field of 4 T
  - Large silicon tracker  $R=1.5$  m
  - QD0 outside detector  
→ increase HCAL forward acceptance

# Towards FCC-ee detectors (option I)

- CLICdet-inspired detector concept
  - Complex forward region
    - smaller magnetic field of  $B=2\text{ T}$
    - larger tracker radius (keep similar momentum resolution)
  - HCAL less deep → lower  $\sqrt{s}$
  - Vertex detector endcap without spirals (no air cooling)

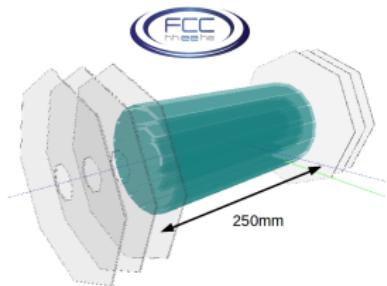

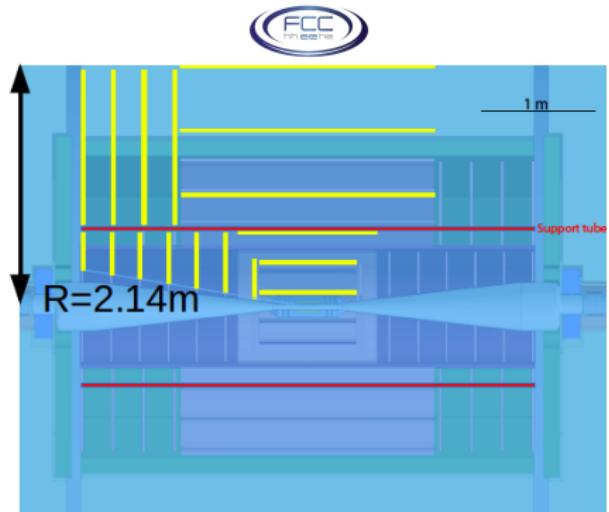

- To be further optimised for different
  - Physics goals
  - Backgrounds
  - Detector cooling requirements

# Towards FCC-ee detectors (option I)

- CLICdet-inspired detector concept
  - Complex forward region  
→ smaller magnetic field of  $B=2\text{ T}$
  - larger tracker radius (keep similar momentum resolution)
  - HCAL less deep → lower  $\sqrt{s}$
  - Vertex detector endcap without spirals (no air cooling)

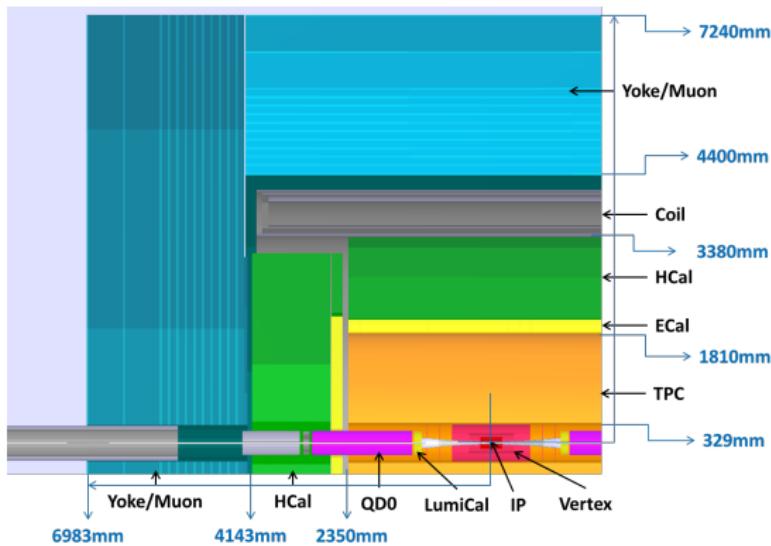

- To be further optimised for different
  - Physics goals
  - Backgrounds
  - Detector cooling requirements

# Towards CEPC detectors (option I)

- ILD-L-inspired detector concept studied for pre-CDR

- Shorter  $L^*$  of 1.5 m  
→ QD0 inside tracker
- Increased cooling infrastructure due to continuous operation
- Thickness of return yoke reduced for both barrel and endcap

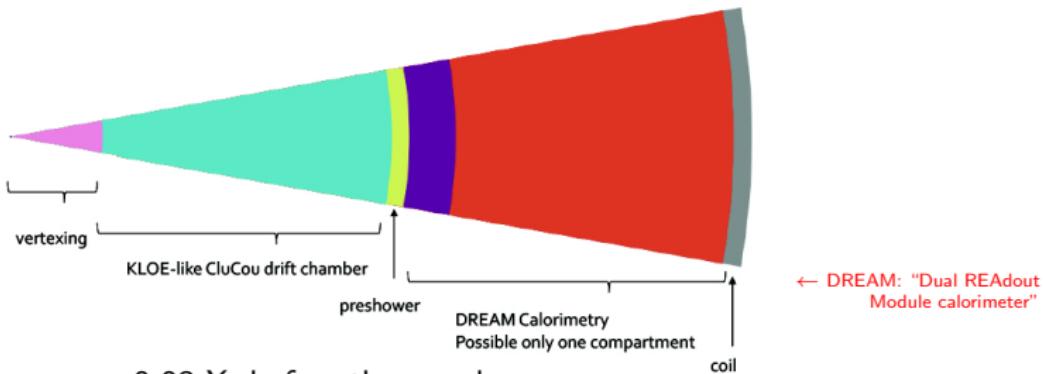

Towards CDR:

- Study 2+ detector concepts
- ILD-like / SiD-like concepts, novel concept (→ "IDEA")

# "IDEA" concept for CEPC/FCC-ee

- IDEA: "International Detector for Electron-positron Accelerator"
- FCC-ee/CEPC detector design from scratch

## • Aims

- Very low mass  $\sim 0.03 X_0$  before the pre-shower
- Muon momentum resolution of 0.3% at  $p=100 \text{ GeV}$
- Acceptance defined at  $\sim 2 \mu\text{m}$  over few metres
- $E/\gamma$  energy resolution  $\sim 1\%$  at  $E=100 \text{ GeV}$
- Jet energy resolution of few % at  $E=100 \text{ GeV}$
- Excellent e- $\mu$ -h separation
- More than  $3\sigma$   $\pi/k$  separation over a wide momentum range
- Very good b and c tagging

# Detector R&D

Disclaimer:

- Showing only examples of recent developments here
- More details and results in parallel session talks

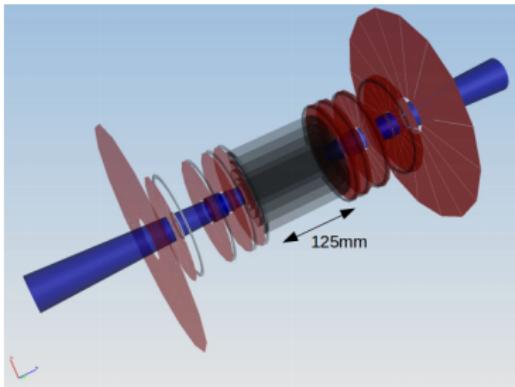

# Vertex and tracking detectors

# Challenges in vertex detector R&D

- Flavour tagging capabilities drive the design of the vertex detector
  - Extremely accurate
  - Extremely light

**SiD vertex detector**

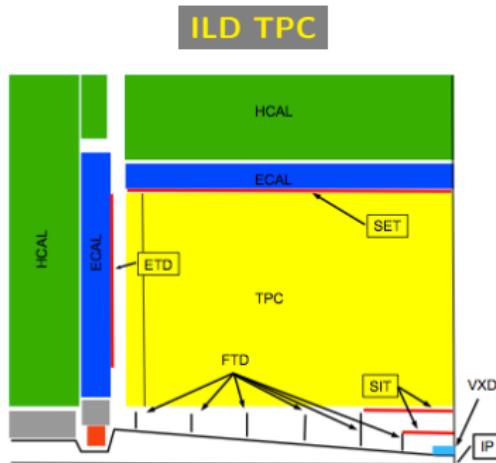

- **LC vertex-detector challenges**
  - $\sim 1 \text{ m}^2$  surface
  - Single point resolution of  $\sigma < 3 - 5 \mu\text{m}$ 
    - Pixel pitch  $\approx 17 - 25 \mu\text{m}$
  - Low power dissipation of  $\leq 50 \text{ mW/cm}^2$
  - Material budget  $< 0.1 - 0.3 \% X_0$  per layer
    - Thin sensors and ASICs, low-mass support, power pulsing, air cooling
  - Time stamping
    - $\sim 10 \text{ ns}$  (CLIC)
    - $\sim 300 \text{ ns} - \mu\text{s}$  dep. on technology (ILC)

- **CC vertex detectors: Differences**
  - Continuous operation → increased cooling
    - increased material budget

# Challenges in tracking detector R&D

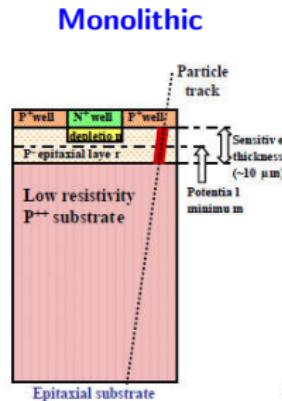

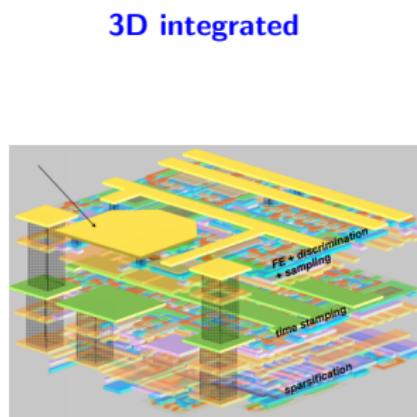

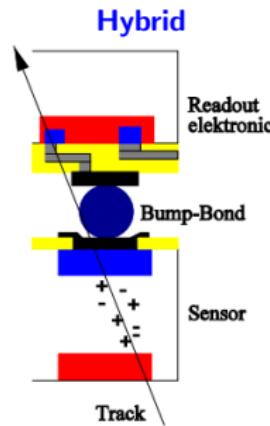

- Very good momentum resolution
- Different concepts, each with large  $B \cdot R^2$ 
  - SiD and CLICdet: all silicon tracker
  - ILD and IDEA: silicon + gaseous tracking

- 1) **Silicon tracker challenges**
  - Large surface area of  $O(100 \text{ m}^2)$ 
    - Use integrated sensors w. large pixels/strips ( $\sim 30 \mu\text{m} \times 1 - 10 \text{ mm}$ )
  - Maintain efficiency and good timing despite large pixel area
  - Mechanical stiffness vs. very little material budget
    - Light-weight support structure and cooling concepts
- 2) **TPC challenges**
  - Ion back flow impacts on resolution
    - Gating concepts under study
  - Hit timing and momentum resolution
    - Silicon envelope around TPC
  - Occupancies
    - Meets requirements for ILC
    - Under study for CEPC

# Silicon pixel-detector technologies

Technology	Examples
Hybrid	CLICpix ASIC+planar sensor, HV-CMOS hybrid
Integrated sensor/amplif. + separate r/o	DEPFET, FPCCD
3D integrated	Tezzaron, SOI
Monolithic CMOS	Mimosa CPS, HV-CMOS, HR-CMOS

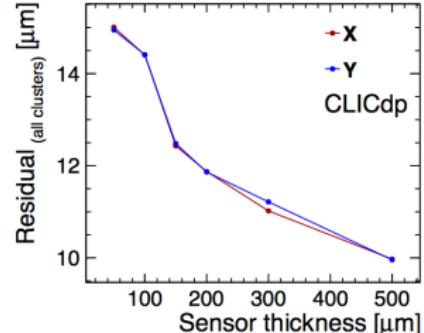

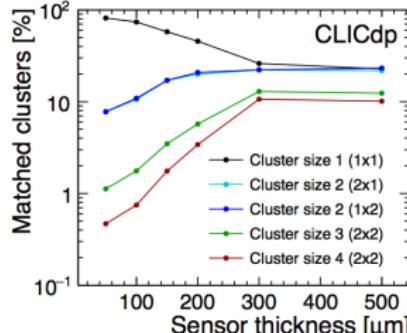

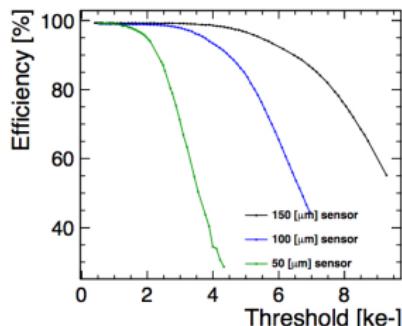

# Hybrid: Extremely thin sensors

700  $\mu\text{m}$  Timepix ASIC + 50  $\mu\text{m}$  sensor

- Classical approach used in LHC pixel detectors

- Independent optimisation of r/o ASIC and sensor
- $e^+e^-$  application: Combine ultra-thin sensors with high-performance r/o ASICs
- Requires bump bonding

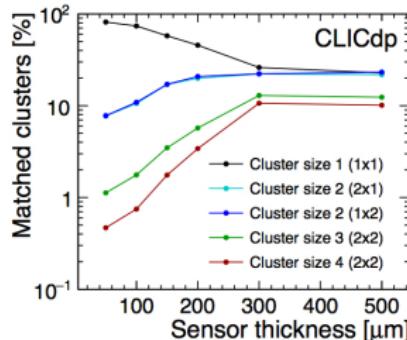

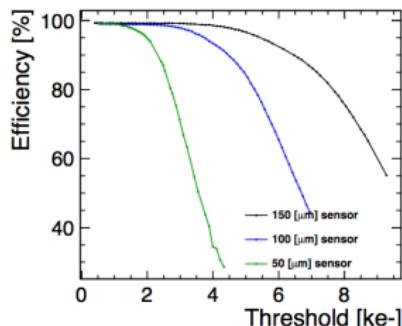

# Hybrid: Extremely thin sensors

700  $\mu\text{m}$  Timepix ASIC + 50  $\mu\text{m}$  sensor

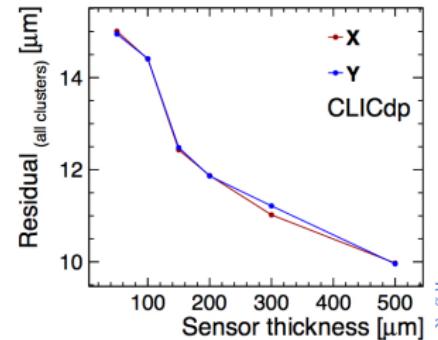

- Classical approach used in LHC pixel detectors

- Independent optimisation of r/o ASIC and sensor
- $e^+e^-$  application: Combine ultra-thin sensors with high-performance r/o ASICs
- Requires bump bonding

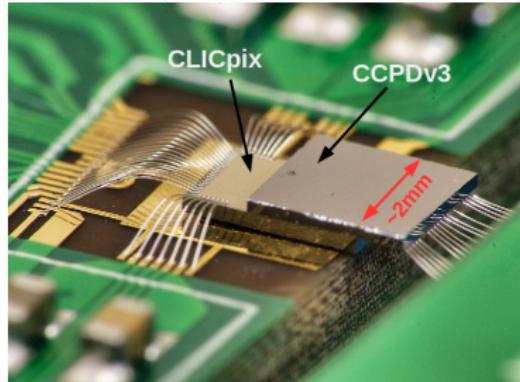

Talk by Andreas Nürnberg (Wed.)

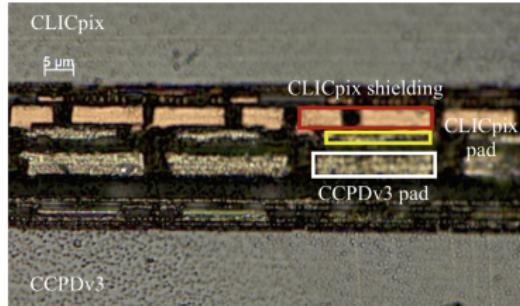

# Hybrid: Capacitive Coupled Pixel Detector (CCPD)

CLICpix ASIC + CCPDv3

Check alignment

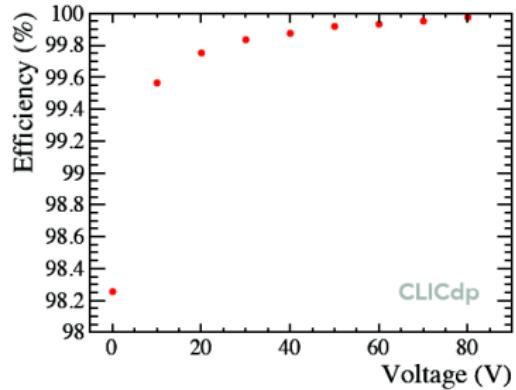

Eva Sicking (CERN)

Detector challenges for high-energy  $e^+e^-$  colliders

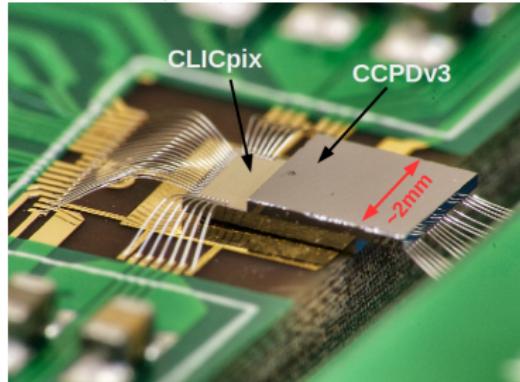

- HV-CMOS chip as integrated sensor+amplifier
- Capacitive coupling to r/o ASIC through layer of glue → **no bump bonding**
- CCPDv3 test sensor for **ATLAS** and **CLIC**
- Proof-of-principle test-beam measurements, e.g. using CLICpix r/o ASIC (25  $\mu\text{m}$  pitch)

Efficiency versus bias voltage

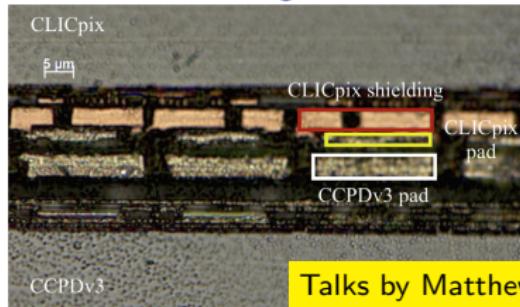

# Hybrid: Capacitive Coupled Pixel Detector (CCPD)

CLICpix ASIC + CCPDv3

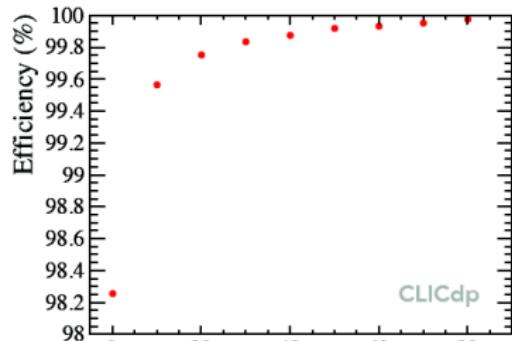

Check alignment

Talks by Matthew Buckland (Thu.), Mateus Vicente (Thu.)

- HV-CMOS chip as integrated sensor+amplifier
- Capacitive coupling to r/o ASIC through layer of glue → **no bump bonding**
- CCPDv3 test sensor for **ATLAS** and **CLIC**
- Proof-of-principle test-beam measurements, e.g. using CLICpix r/o ASIC (25  $\mu\text{m}$  pitch)

Efficiency versus bias voltage

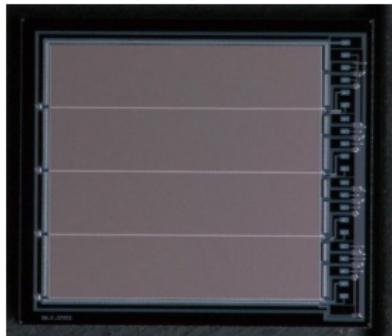

# Semi-integrated technology: FPCCD

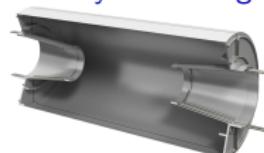

- “Fine Pixel Charge-Coupled Device”  
studied for ILD vertex detector
- Semi-integrated technology (separate r/o ASICs)
- Thickness of  $50\text{ }\mu\text{m}$ , but material pushed to endcaps
- Trade-off:
  - Pixel pitch down to  $5\text{ }\mu\text{m}$   
 $\rightarrow 1.4\text{ }\mu\text{m}$  res. for single pixel hits
  - Integrate over full ILC bunch trains  
 $\rightarrow$  no time stamps
  - Background rejection by pattern recognition
- Operation at  $-40^\circ\text{C}$  in cryostat using  $\text{CO}_2$  cooling

FPCCD prototype

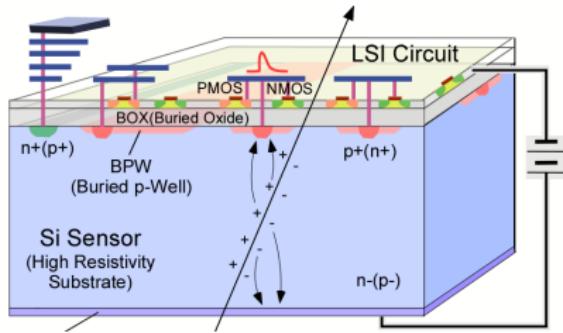

Pixel pitch 6, 12, 18, 24  $\mu\text{m}$   
 $6 \times 6\text{ mm}^2$

 $12 \times 62\text{ mm}^2$  (real size sensor)

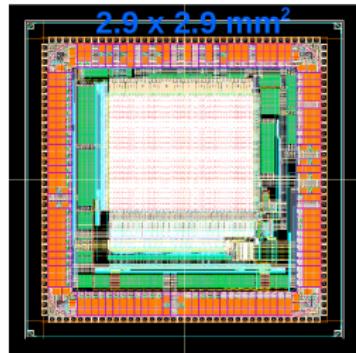

Cryostat design

# 3D integrated: Silicon on Insulator (SOI)

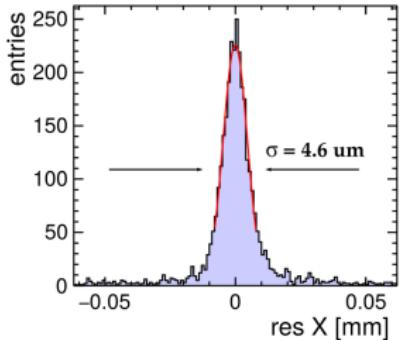

"SOI sens. for Fine meas. of Space & Time"  
SOFIST 25  $\mu\text{m}$ -pitch test chip (KEK)

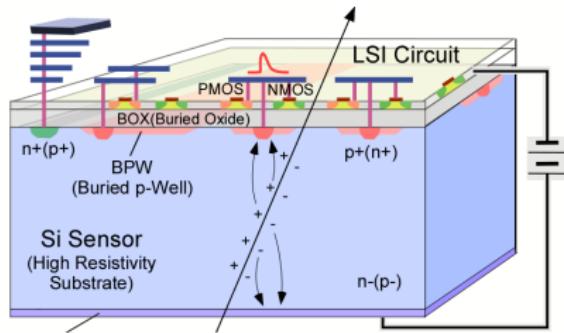

- Monolithic pixel detectors in SOI
- SOI R&D ongoing for **CEPC, ILC and CLIC**
  - Thin SOI CMOS (200 nm feature size) and thick sensor bulk
  - High-resistive fully depleted sensor  
→ **Large S/N and high speed**
  - Pixel pitch down to 10  $\mu\text{m}$
  - Thickness down to 50  $\mu\text{m}$

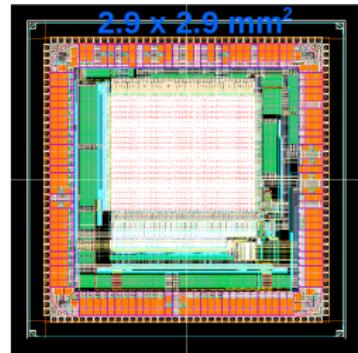

AGH SOI 30  $\mu\text{m}$ -pitch sensor: resolution

# 3D integrated: Silicon on Insulator (SOI)

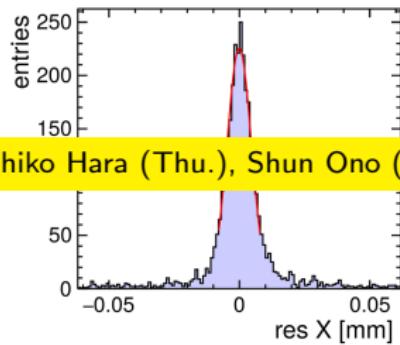

"SOI sens. for Fine meas. of Space & Time"  
SOFIST 25  $\mu\text{m}$ -pitch test chip (KEK)

- Monolithic pixel detectors in SOI
- SOI R&D ongoing for **CEPC, ILC and CLIC**
  - Thin SOI CMOS (200 nm feature size) and thick sensor bulk

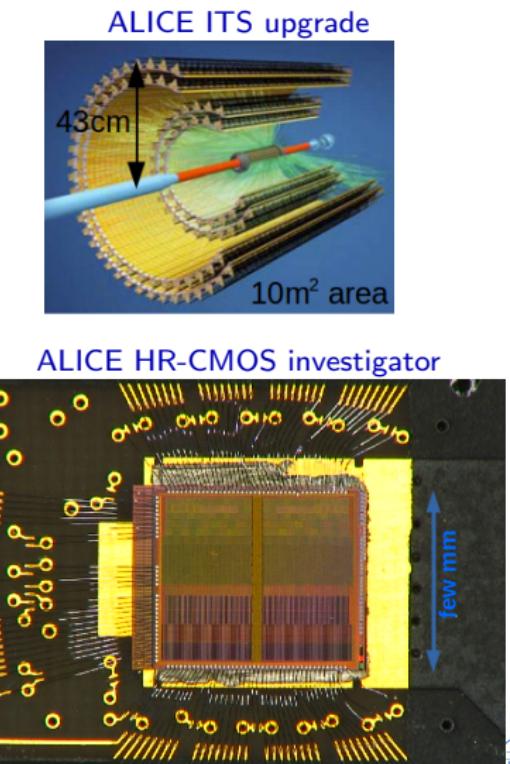

Talks by Marco Meschini (Wed.), Yunpeng Lu (Thu.), Kazuhiko Hara (Thu.), Shun Ono (Thu.)

- Large S/N and high speed
- Pixel pitch down to 10  $\mu\text{m}$
- Thickness down to 50  $\mu\text{m}$

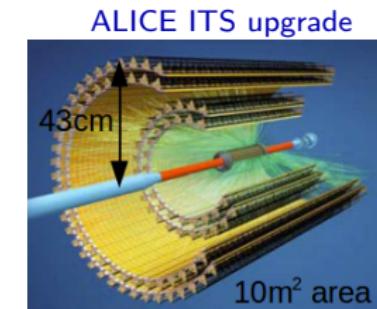

# Monolithic Active Pixel Sensor (MAPS)

- Fully integrated CMOS technology
- Early generations
  - Charge collection mainly diffusion, **timing limited by rolling-shutter r/o ( $\mu$ s)**
- Recent advances
  - Moving towards smaller feature size (180 nm, Tower Jazz) and higher-resistivity substrates (few kOhm cm) → HR-CMOS
  - Promising timing performance
- Successfully deployed in HEP, with increasingly demanding requirements:
  - Test-beam telescopes
  - STAR @ RHIC
  - CBM MVD @ FAIR
  - ALICE ITS upgrade
  - Baseline technology for **ILD VTX**, under study for **CEPC** and **CLIC**

# Example: cooling and power pulsing

Vertex detector with low material budget

- Micro-channel cooling
  - Low volumetric flow ( $1\text{l/h}$ ) and low pressure ( $< 1\text{ bar}$ ) enough to dissipate the heat in the front end
- Air cooling
  - Heat load of  $13 - 50\text{ mW/cm}^2$  extractable using air flow
- Power pulsing
  - Small duty cycles → turn off front end in gaps between bunch trains

Test setup for power pulsing

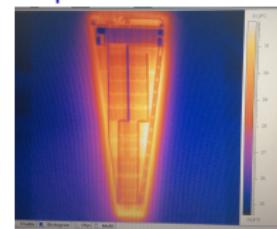

Eva Sicking (CERN)

Detector challenges for high-energy  $e^+e^-$  colliders

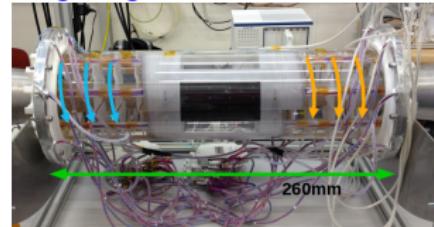

DEPFET Micro-channel cooling

ILD FTD temperature meas. in wind tunnel

Cooling using air flow: 1:1 scale mock-up

May 22, 2017

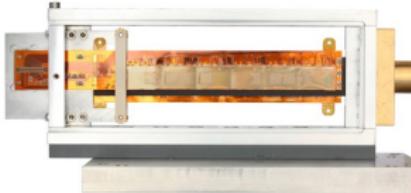

38 / 51

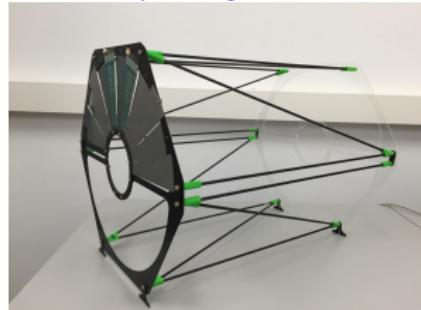

# Example: Light support structures

- Low material budget requirements → light-weight support
- Synergies with LHC experiment upgrades

Plume ladder equipped with CPS

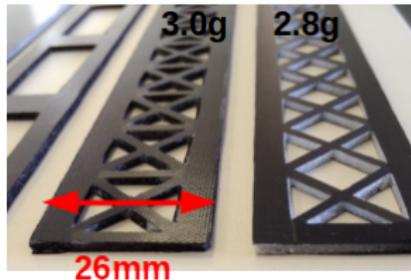

ILD FTD mock-up  
carbon-fiber + CF tubes + 3D  
printed joints

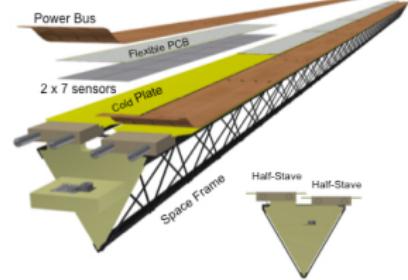

SiD tracker support prototype  
based on CFRP box channels

CLIC vertex det. support prototype  
carbon fibre + honeycomb core

Talk by Huirong Qi (Thu.)

# Calorimetry

# Particle flow calorimeters

Pursued for ILC, CLIC, CEPC and FCC-ee

3%–4% jet energy resolution reachable with **Particle Flow Analysis (PFA)**

Idea:

- Average jet composition
  - 60% charged particles
  - 30% photons
  - 10% neutral hadrons
- Always use the best information
  - 60% → tracker 
  - 30% → ECAL 
  - 10% → HCAL 

# Particle flow calorimeters

Pursued for ILC, CLIC, CEPC and FCC-ee

3%–4% jet energy resolution reachable with **Particle Flow Analysis (PFA)**

Idea:

- **Average jet composition**
  - 60% charged particles
  - 30% photons
  - 10% neutral hadrons
  
- **Always use the best information**
  - 60% → tracker 😊
  - 30% → ECAL 😊
  - 10% → HCAL 😞

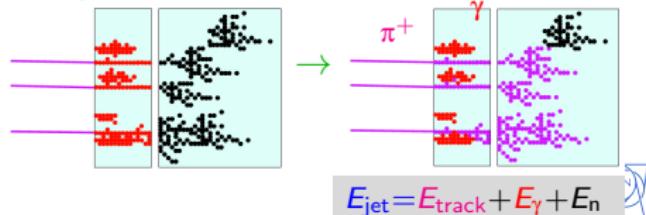

## Particle Flow Analysis: Hardware + Software

- **Hardware:** Resolve energy deposits from different particles  
→ **High granularity calorimeters**

$$E_{\text{jet}} = E_{\text{ECAL}} + E_{\text{HCAL}}$$

- **Software:** Identify energy deposits from each individual particle  
→ **Sophisticated reco. software**

$$E_{\text{jet}} = E_{\text{track}} + E_{\gamma} + E_n$$

# Particle flow calorimeters

Pursued for ILC, CLIC, CEPC and FCC-ee

3%–4% jet energy resolution reachable with **Particle Flow Analysis (PFA)**

Idea:

- **Average jet composition**
  - 60% charged particles
  - 30% photons
  - 10% neutral hadrons
- **Always use the best information**
  - 60% → tracker ☺
  - 30% → ECAL ☺

## Particle Flow Analysis: Hardware + Software

- **Hardware:** Resolve energy deposits from different particles  
→ **High granularity** calorimeters

$$E_{\text{jet}} = E_{\text{ECAL}} + E_{\text{HCAL}}$$

ALICE: Yota Kawamura (Tues.), Hongkai Wang (Tue.)

: Identify energy deposits

CALICE: Yong Liu (Tue.), Boruo Xu (Tue.), Burak Bilki (Thu.), Imad Laktineh (Thu.)

→ **Sophisticated reco. software**

CEPC: Zhigang Wang (poster)

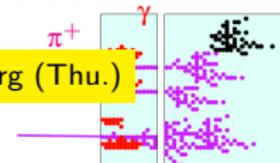

CMS HGCal: Florian Pitters (Tue.), Francesco Romeo (Tue.), Johan Borg (Thu.)

FCC-hh: Coralie Neubüser (Wed.)

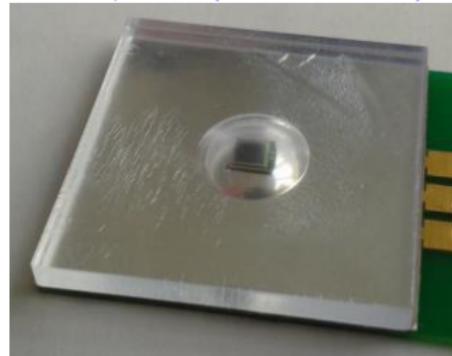

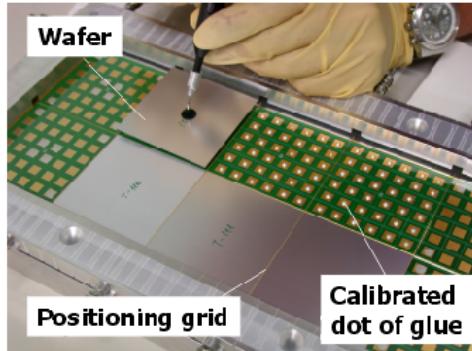

Front-end electronics: Christophe De La Taille (Wed.)

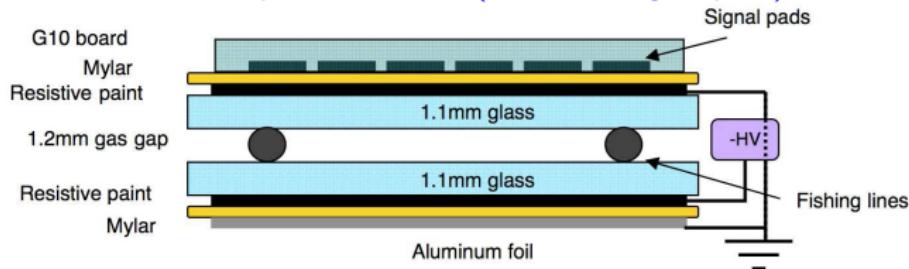

$$E_{\text{jet}} = E_{\text{track}} + E_{\gamma} + E_n$$

# Calorimetry: Active layer technology: Examples

Silicon PIN diodes ( $1 \times 1 \text{ cm}^2$  in  $6 \times 6$  matrices) Scintillator tiles/strips (here  $3 \times 3 \text{ cm}^2$ ) + SiPMs

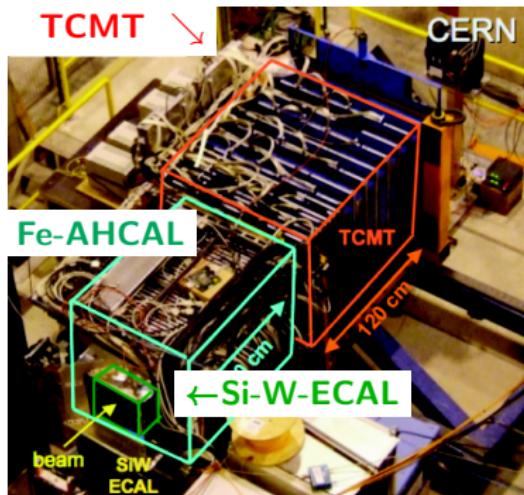

Resistive place chambers ( $1 \times 1 \text{ cm}^2$  signal pads)

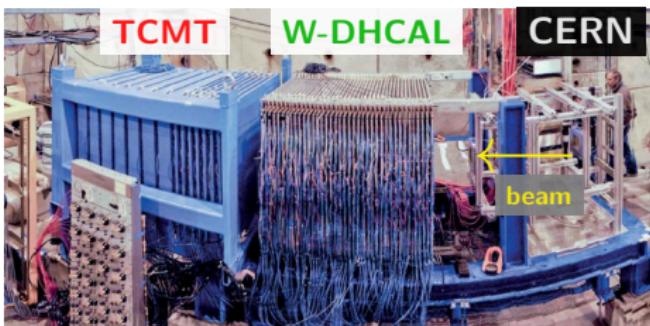

# CALICE test beam experiment: Examples

- Test beam experiments in 2006–2015 at DESY, CERN, FNAL
- First physics prototypes of up to  $\sim 1\text{ m}^3$ ,  $\sim 2\text{ m}^3$  including Tail Catcher Muon Tracker

AHCAL/Si-ECAL:  $\sim 10\,000$  readout channels

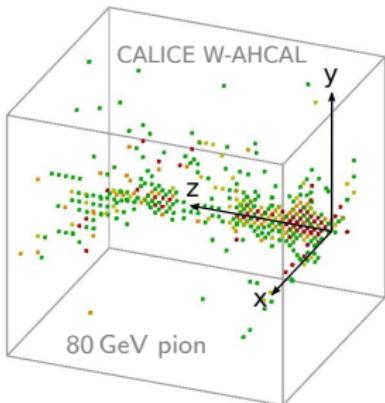

DHCAL:  $\sim 500\,000$  readout channels

- Detector challenges:
  - Compact design of calorimeters
  - Calibration of all channels

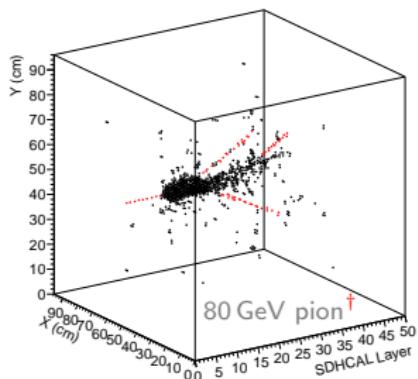

# CALICE event displays

- Trade-off between energy resolution and granularity

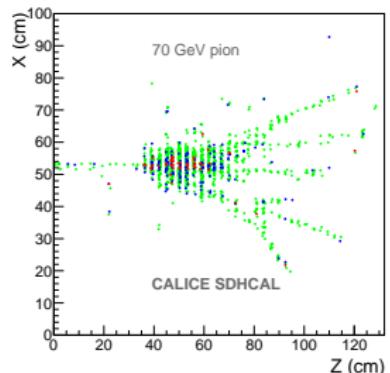

Analogue HCAL

Digital HCAL

Semi-digital HCAL

- $3 \times 3 \text{ cm}^2$  cells,  
analogue energy  
information per cell

- $1 \times 1 \text{ cm}^2$  cells,  
count cells above one  
energy threshold

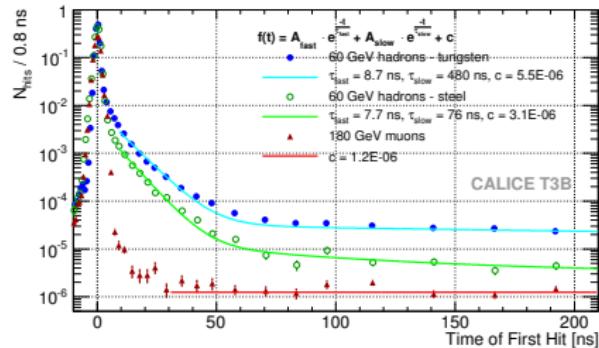

<sup>†</sup>hits from identified tracks within shower

- $1 \times 1 \text{ cm}^2$  cells,  
count cells above three  
energy thresholds

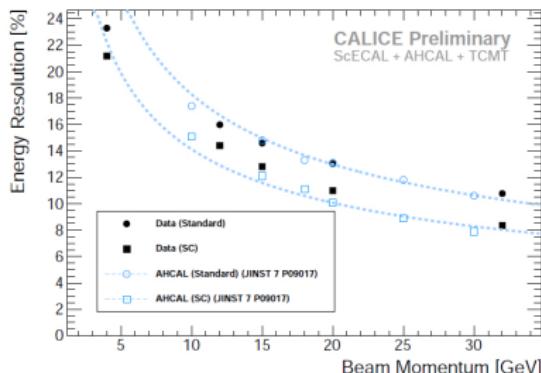

# CALICE example results

## Time structure: W vs. Fe HCAL

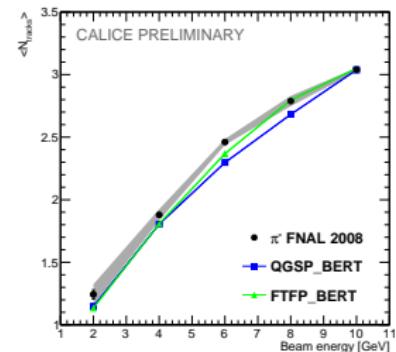

## Pion energy resolution: ECAL+HCAL

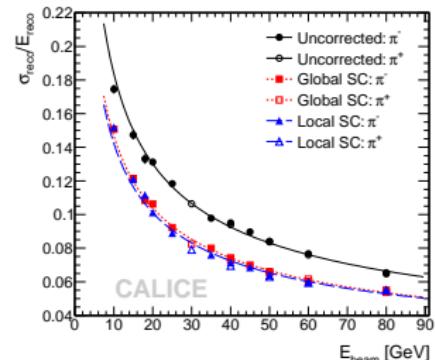

Eva Sicking (CERN)

Detector challenges for high-energy  $e^+e^-$  colliders

## Shower sub-structure: N\_tracks in Si-W-ECAL

## Software compensation

# SiD Si-W ECAL

## Si-W-ECAL schematics

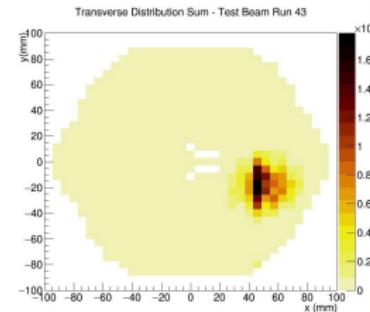

Si-sensor with KPiX

SiD ECAL in test beam

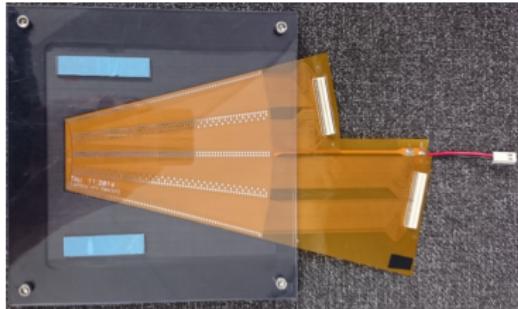

- Highly-granular calorimeter development: Si-W-ECAL for SiD@ILC
- Status: establish scalability
  - Embedded electronics for compact detector: here kPiX
  - Demonstrate feasibility of construction of compact calorimeter

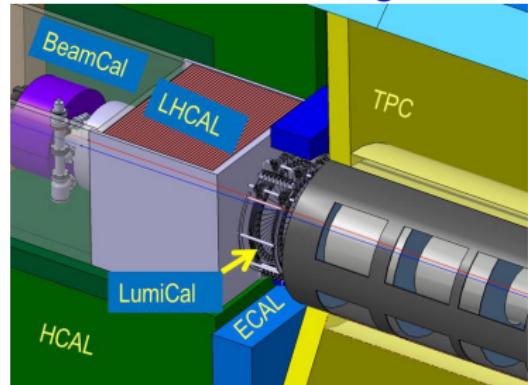

# Forward CALorimetry: FCAL

- Very forward e.m. calorimeters
  - LumiCal for luminosity measurement ( $< \pm 1\%$  accuracy)
  - BeamCal for very forward electron tagging
- $e^-$  and  $\gamma$  acceptance to small angles
- Very compact design (sensors, read-out, absorber) → small Molière radius
- BeamCal: GaAs, LumiCal: silicon

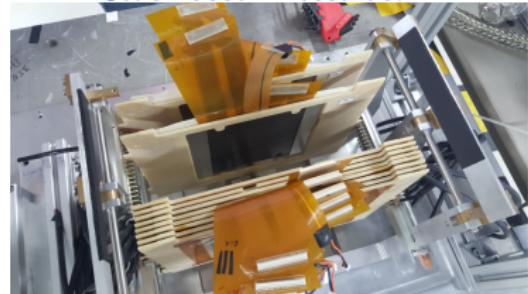

## LumiCal module with Si sensor (one sector)

## ILD@ILC forward region

## Stack used in test beam

# Summary

# Summary

- $e^+e^-$  colliders are **precision** machines with a large physics potential
- Existence of many  $e^+e^-$  collider studies shows **world-wide interest in  $e^+e^-$  physics**
- Interest increased since Higgs discovery at the LHC
- Detailed studies on  $e^+e^-$  detector concepts
  - Demanding requirements and **ambitious concepts**
  - Requirements depend on **physics goals and experimental conditions**
  - Large synergies between collider projects and already approved experiments
  - Active detector collaborations and **R&D spin-offs**

# Backup

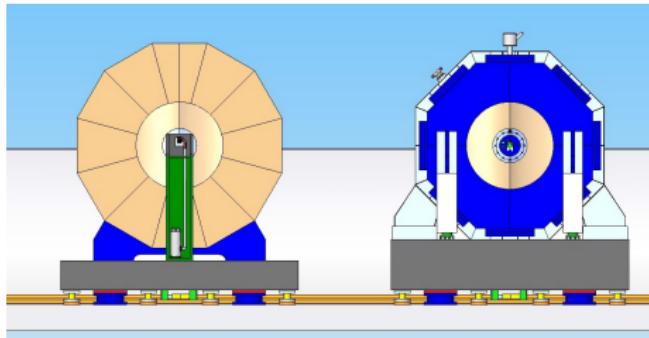

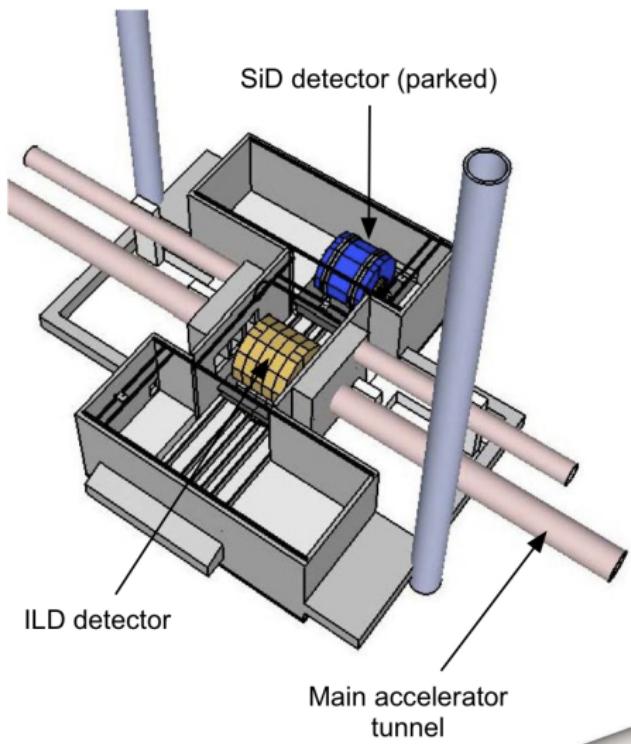

# Beam strahlung and luminosity spectrum

- LCs achieve high luminosity via small beam size → leads to beamstrahlung
- Energy loss reduces collision energy
- 1% most energetic part
  - ~ 60% at 500 GeV and 1 TeV ILC
  - ~ 60% at 380 GeV CLIC
  - ~ 35% at 3TeV CLIC

- Most physics processes are studied well above production threshold
- Can profit from almost full luminosity also at LCs

# ILC detectors - Push-pull

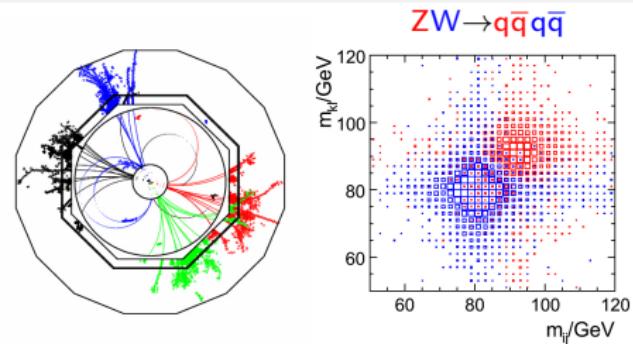

- Only one interaction point at a linear collider
- Plan to exchange ILD and SiD regularly for data taking
- Movable platforms, keeping all services connected
- Fast alignment

# Calorimeter optimised for particle flow

Pursued for ILC, CLIC, CEPC and FCC-ee

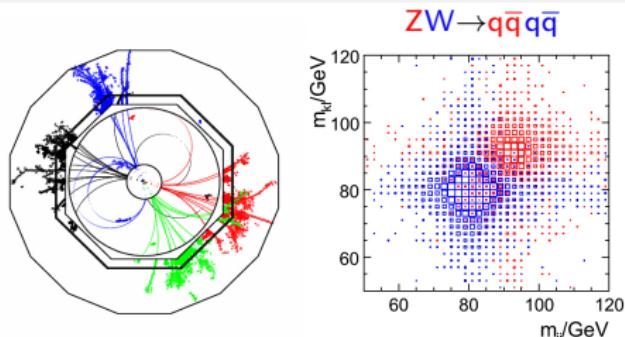

- Jet energy resolution (JER) requirements depend on physics goals
- Starting point for LC detector design  
→ Ability to separate hadronic W and Z decays

# Calorimeter optimised for particle flow

Pursued for ILC, CLIC, CEPC and FCC-ee

- Jet energy resolution (JER) requirements depend on physics goals
- Starting point for LC detector design  
→ Ability to separate hadronic W and Z decays

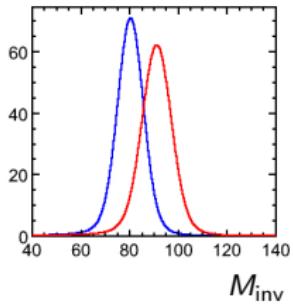

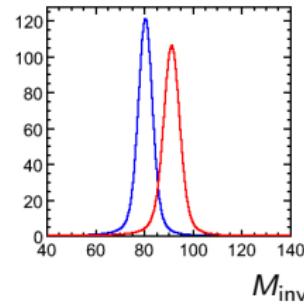

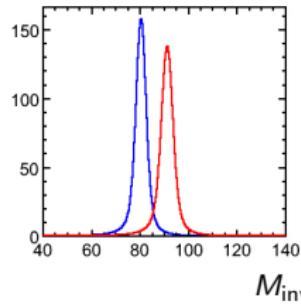

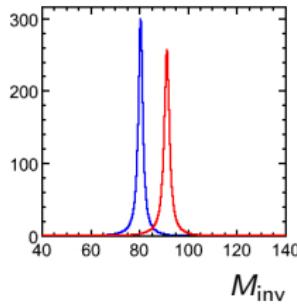

Perfect → 3.1 $\sigma$  W/Z sep.

2% JER → 2.9 $\sigma$  sep.

3% JER → 2.6 $\sigma$  sep.

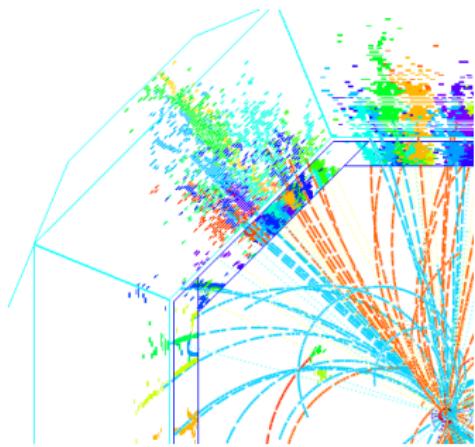

6% JER → 1.8 $\sigma$  sep.

- 3%–4% jet energy resolution gives  $\sim 2.6 - 2.3\sigma$  W/Z separation

# Optimise calorimeter for particle flow

→ Reco. details next slide

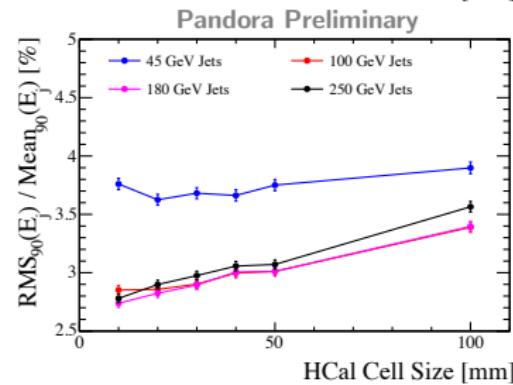

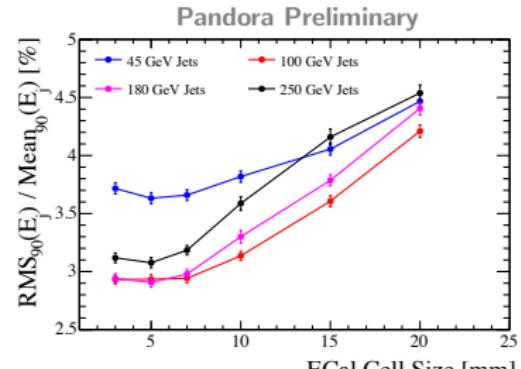

- High granularity of calorimeters

- Separate overlapping showers to reduce confusion

$$\sigma_{\text{jet}} = \sqrt{\sigma_{\text{track}}^2 + \sigma_{\text{el.-m.}}^2 + \sigma_{\text{had.}}^2 + \sigma_{\text{confusion}}^2}$$

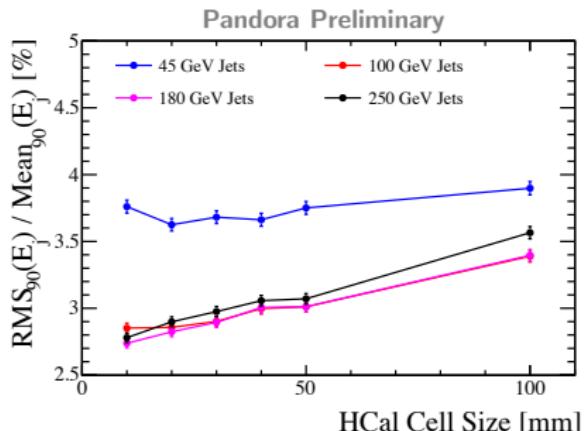

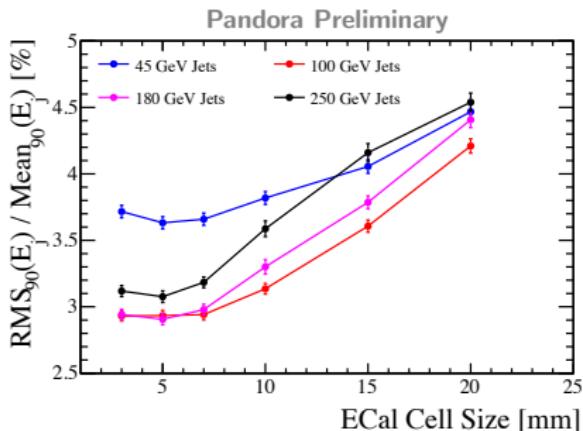

- JER of 3%–4% when using

- ECAL cell size:  $\sim 1 \times 1 \text{ cm}^2$
- HCal cell size:  $\sim 3 \times 3 \text{ cm}^2$

$\text{rms}_{90}$  and  $\text{mean}_{90} \triangleq \text{rms}$  and  $\text{mean}$  in smallest range of  $E_{\text{rec}}$  dist. containing 90% of events

# Reconstruction information for cell size optimisation

- HCal timing cuts: 100 ns
- ECal timing cuts: 100 ns
- HCal Hadronic Cell Truncation: Optimised for each detector model
- Software: ilcsoft\_v01-17-07, including PandoraPFA v02-00-00
- Digitiser: ILDCaloDigi, realistic ECal and HCal digitisation options enabled
- Calibration: PandoraAnalysis toolkit v01-00-00
